Reviews

The very best publication i at any time study. It really is basic but shocks inside the fifty percent of the ebook. It is extremely difficult to leave it before concluding, once you begin to read the book.

Not illustrated. 1904 Excerpt: . the calorimeter and the weight of the products of combustion, the heat given up for the temperature difference can be calculated. A glass tube bent to the required shape was placed into the flue and a number of samples taken of which the following is the average analysis: $\text{CO}_2 = 6.3$ percent. $\text{O} = 14.55$ per cent. $\text{N} = 79.15$ per cent. To find the amount of air used we must first calculate the analysis of the products of combustion if just enough air were supplied to completely burn the gas. The relation between the percentages of CO_2 in both cases gives the quantity of air actually used during the test. AIR REQUIRED FOR COMPLETE COMBUSTION PER KILOGRAM OF GAS BURNED $0.25613 \text{ kg. CO require } 0.25613 \times 0.14635 \text{ kg. O forming } 0.25613 + 0.14635 = 0.40248 \text{ kg. CO } 0.00638 \text{ kg. CH}_4 \text{ require } 0.00638 \times 4 = 0.02552 \text{ kg.
